Center function

Centering can be done to eliminate mechanical offsets. To execute centering connect center input to ground ($>0,5\text{sec}$) within 1 min. after power up. After centering you have 1 min. left for another centering. Normally the center input should be left unconnected.

Optional: for accurate mounting two factory mounted positioning pins can be mounted ($\varnothing 4\text{mm}$) replacing 2x M5x25 mm.

As this device is accelerometer-based the sensor is inherent sensitive for accelerations/vibrations. Application specific testing must be carried out to check whether this sensor will fulfil your requirements.
